

Do you struggle understanding speech in noise?

Participants wanted for an auditory training study involving non-invasive brain stimulation (tACS)

The Communication Neuroscience Research Lab at Boston University is looking for participants for a study involving listening to speech and identifying words while receiving a form of non-invasive brain stimulation called transcranial alternating current stimulation (tACS). Participants will also complete a computer or app-based auditory training program at home.

Details:

- \$20/hour compensation for four in-lab visits
- In-person at 635 and 610 Commonwealth Ave, Boston MA 02215

All participants must:

- be an adult (ages 50 years and older) who is a native English speaker
- struggle to understand speech when more than one person is talking
- be safe for non-invasive brain stimulation (have no history of seizures or serious head injury)
